- × Subcutaneous vs. Intramuscular injections
- Injection sites
- Syringe handling techniques
- × Practice if time

- What can you inject?
 - + Vaccines
 - + Antibiotics
 - + Vitamins
 - + Parasite treatments
 - + Immune stimulants
 - + Reproductive hormones

- Subcutaneous (SQ)-30-45 degree angle
- Intramuscular (IM)perpendicular to skin
- Do not inject more than 10 cc in one site. 20 cc on adult cattle

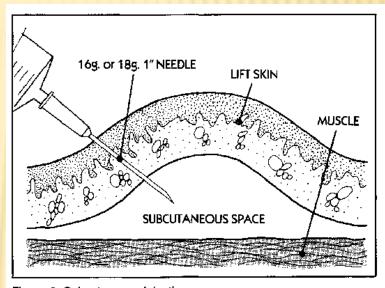

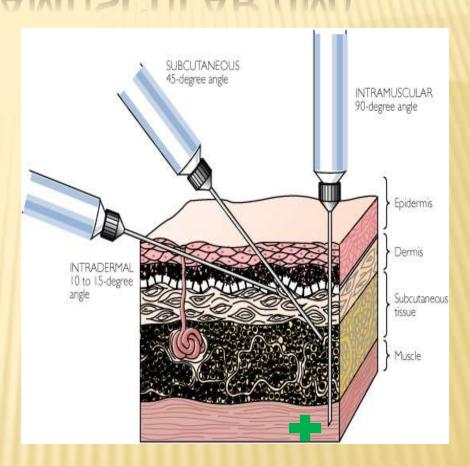

Figure 2, Subcutaneous injection.

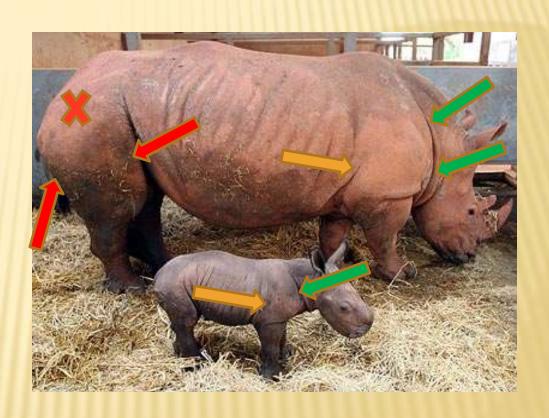

INJECTIONS - INTRAMUSCULAR (IM)

- Intramuscular (IM)perpendicular to skin
- Determine injection site
- Gloves & Alcohol (+/-)
- Insert needle through skin, subcutaneous layers and into muscle
- Pull back on plunger checking for signs of blood or air
- Administer the injection
- Remove the needle from the skin and gently rub the injection site
- Cap the needle and place in a sharps container

- Injection sites
 - + Neck
 - + Axillary
 - + Rear leg Always a 'last resort' injection site
 - + Beef Quality Assurance

Young animals

- Injection site on neck
- * Landmarks
 - Front of shoulder blade – hand width on adults
 - + Top of neck line
 - Bottom of cervical vertebrae
 - + Split the difference
 - + Triangular area

- Use appropriate size syringe & sharp needle
 - + 20 (pink) to 22 (blue) gauge needle for vaccines
 - + 16 (grey) to 18 (green) gauge needle for antibiotics

* Technique

- + Good restraint on animal
- Hold syringe near base of needle
- Bevel of needle facing outcuts better
- Quickly push needle through skin
- Pull back on plunger, look for air/blood
- + Inject material & rub
